

CSE370: Database Management System Assignment on Functional Requirements

Proposed Project Title: Project Title

Group No: 08, CSE370 Lab Section: 11, Summer 2026		
SL	ID	Name
1	24301372	Shadeed Aarshan
2	24301362	Nuzhat Tabassum Oishee
3	24301348	Kazi Aryan

Submission Date:27/06/2026

Project Overview

The **Disaster Relief Management System** is a platform designed for efficient management of relief resources, volunteers, donors and disaster zones. This system enables administrators to track warehouse inventories, relief shipments, oversee the areas which are affected by disasters and supervise volunteers. It keeps a record of relevant data for each disaster zone, which includes location, severity and current state, so that admins can allocate volunteers and resources more efficiently. It also supports management of donors by keeping records of them. Donors can be of three distinct types- NGO, individual and corporate donors. Corporate donors are

recognized by tax ID and a tier based ranking system.

Moreover the platform provides secure authentication for all users, who are either admins or customers, ensuring that all the users are recognized by the platform and that they can access all the relevant features. The system also enables automated inventory monitoring along with low-stock alerts and expiry date review that help maintain the availability and quality of the relief supplies. Additionally, volunteers are tracked to be matched and deployed, depending on their availability, to improve the efficiency of emergency response operations. Overall, the system aims to improve coordination and timely delivery of aid and supplies during disasters.

Tech Stack:

- · Language: python, HTML, CSS, SQL
- · Frontend Framework: html
- · Backend Framework: Flask
- · Styling: CSS
- · Database: MySQL
- · ODM: N/A
- · Deployment: LocalHost/XAMPP
- · External APIs:N/A

Functional Requirements

Module 3	
Member	Feature Description
Oishee	Warehouse Management & Inventory Assignment: allows administrators to register and manage disaster relief warehouses. Administrators can view warehouse information and assign inventory items to specific warehouses, including their shelf locations. This helps track which items are stored in each warehouse and where they are located, making inventory organization and relief distribution more efficient. Main functions: ● Register and manage warehouses ● View warehouse information ● Assign inventory items to warehouses ● Record shelf locations ● View items stored in each warehouse
Oishee	Inventory Stock Monitoring & Low-Stock Management: provides administrators with a centralized view of inventory items and their current stock levels. The system displays information such as item names, categories, and quantities, allowing administrators to monitor available relief supplies. Items with low quantities can be identified for restocking, helping ensure that essential supplies remain available during disaster response. Main functions: ● View all inventory items

	● Monitor current quantities and categories ● Identify items requiring restocking ● Update inventory stock levels ● Add or remove stock when necessary
Oishee	Expiry Date Auditor: monitors the expiration dates of relief supplies and calculates the number of days remaining before each item expires. Items that are close to expiry or already expired are clearly flagged, allowing administrators to prioritize their distribution or remove and replace unusable supplies. Main functions: ● Monitor inventory expiration dates ● Calculate days remaining until expiry ● Flag urgent and expired items ● Help prioritize items for distribution ● Support timely replacement of expired supplies
